GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Calos, Michele P.
APPLICANT: Sclimenti, Christopher R.
APPLICANT: Sclimenti, Christopher R.
TITLE OF INVENTION: ALTEERED RECOMBINASES FOR GENOME MODIFICATION
FILE REFERENCE: 8400-0011
CURRENT APPLICATION NUMBER: US/09/788,297
CURRENT FILING DATE: 2001-02-16
NUMBER OF SEQ ID NOS: 34
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 27
LENGTH: 1839
TYPE: DAN
ORGANISM: Artificial Sequence

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The self-excising polynucleotide is useful for producing transgenic plants, particularly for removing all transgenic nucleic acid sequences that encode a gene product from the transgenic plant, thus restoring the original genetic configuration of the genome. The polynucleotide is also useful in methods for eliminating unwanted nucleic acids in agricultural food products and for preventing the escape of certain transgenic traits into the environment. This sequence encodes the novel phic31 integrase phic31int*INT, created for use in the self-excising polynucleotide described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim

                                                                                   The invention describes an isolated excisable polynucleotide, which comprises a desired trait polynucleotide and a recombinase polynucleotide operably linked to a promoter, all flanked by a pair of directly oriented recombination sites where the recombinase activity is regulatable. The self-excising polynucleotide is useful for producing transgenic plants, particularly for removing all transgenic nucleic acid sequences that encode a gene product from the transgenic plant, thus restoring the original genetic configuration of the genome. The polynucleotide is also useful in methods for eliminating unwanted nucleic acids in agricultural food products and for preventing the escape of certain transgenic traits into the environment. This sequence encodes the novel phic31 integrase phic31intINT, created for use in the self-excising polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Phi C31 integrase; recombinase; transgenic; plant;

The self-excising polynucleotide is useful for producing transgenic plants, particularly for removing all transgenic nucleic acid sequences that encode a gene product from the transgenic plant, thus restoring the original genetic configuration of the genome. The polynucleotide is also useful in methods for eliminating unwanted nucleic acids in agricultural food products and for preventing the escape of certain transgenic traits into the environment. This sequence represents the plasmid pBPS EW051 TDNA region used to test the self-excising DNA described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (BADI )
